High throughput Virtual Screening with AutoDOCK vina program

Asst.Prof Sefer BADAY

İTÜ Faculty of Computer and Informatics Engineering

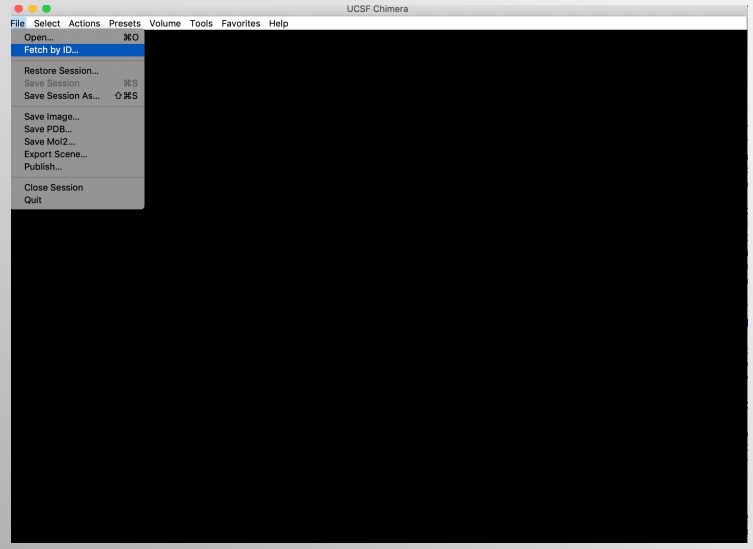
ncc@ulakbim.gov.tr

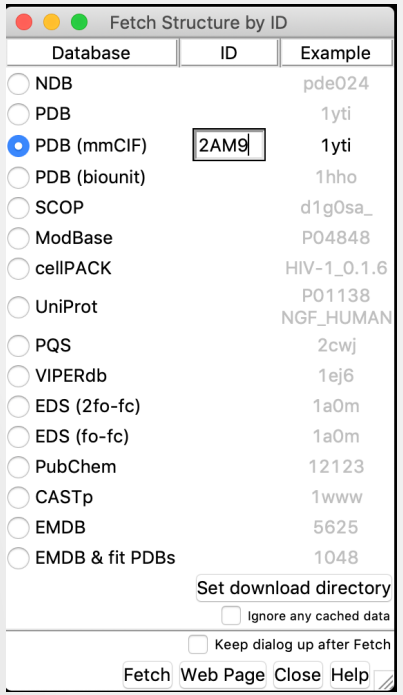
Lesson 1: Preparing protein for docking calculations

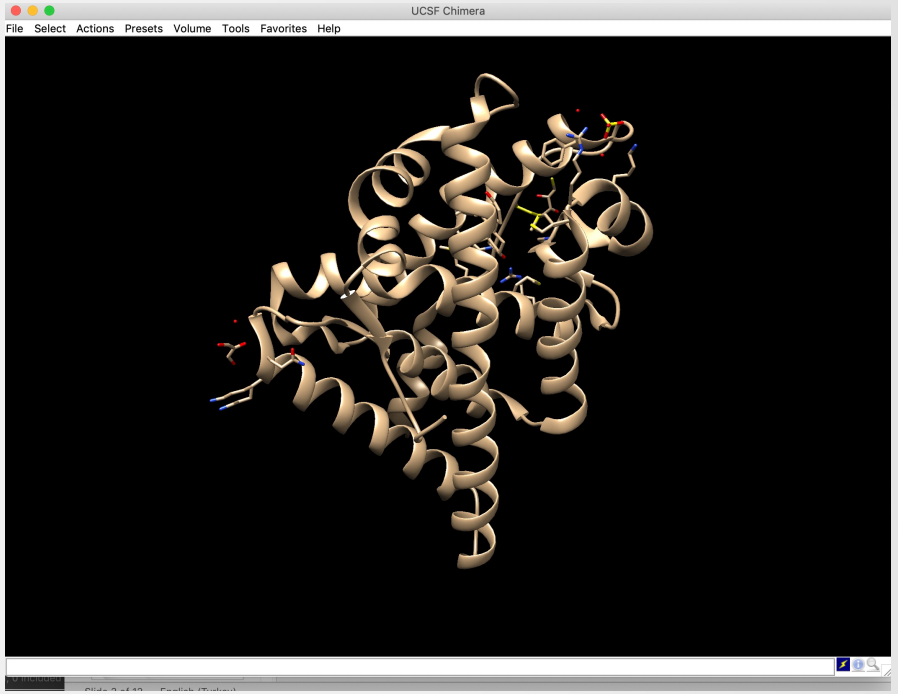
- AutoDock Vina works with a special file format called **pdbqt**.
- We need to create pdbqt file for the protein of interest.
- There are a couple of ways to do this.
- Chimera program, which is a free software, can be used.
- The next slides will guide you how you can create a pdbqt.

Loading the protein pdb file

- From File menu select open or Fetch by ID.
- We will download the protein structure from protein data bank (pdb) that is why we selected fetch by ID menu
- Write 2AM9 to the pdb section and click Fetch.
- It will download the pdb file to your local computer

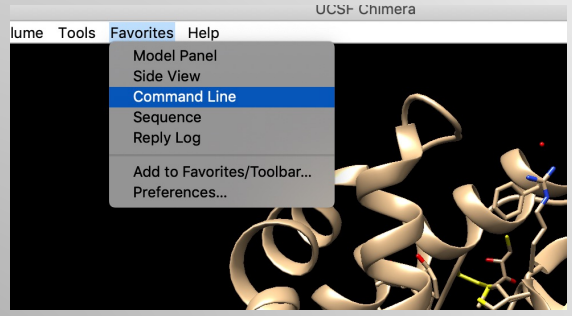


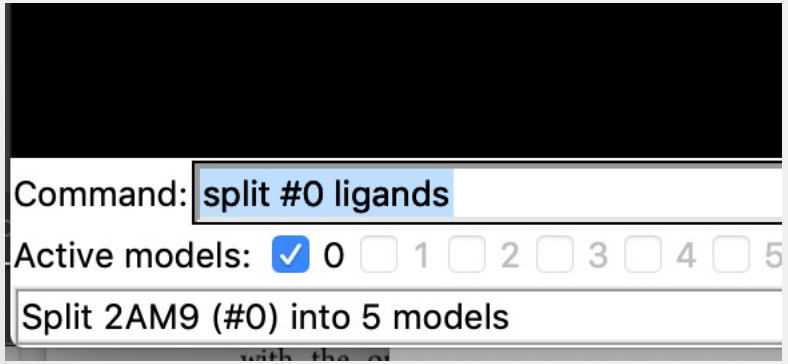




Splitting ligand in the pdb file

- In this pdb file there is ligand in the binding site.
- We will split the pdb file into protein and ligands, this will be useful later when we want to create grid box
- If there is no ligand in the pdb file you work with you can skip this stage
- From Favorites select Command Line
- Type split #0 ligands and press enter
- This will create a separate models for protein and other ligands



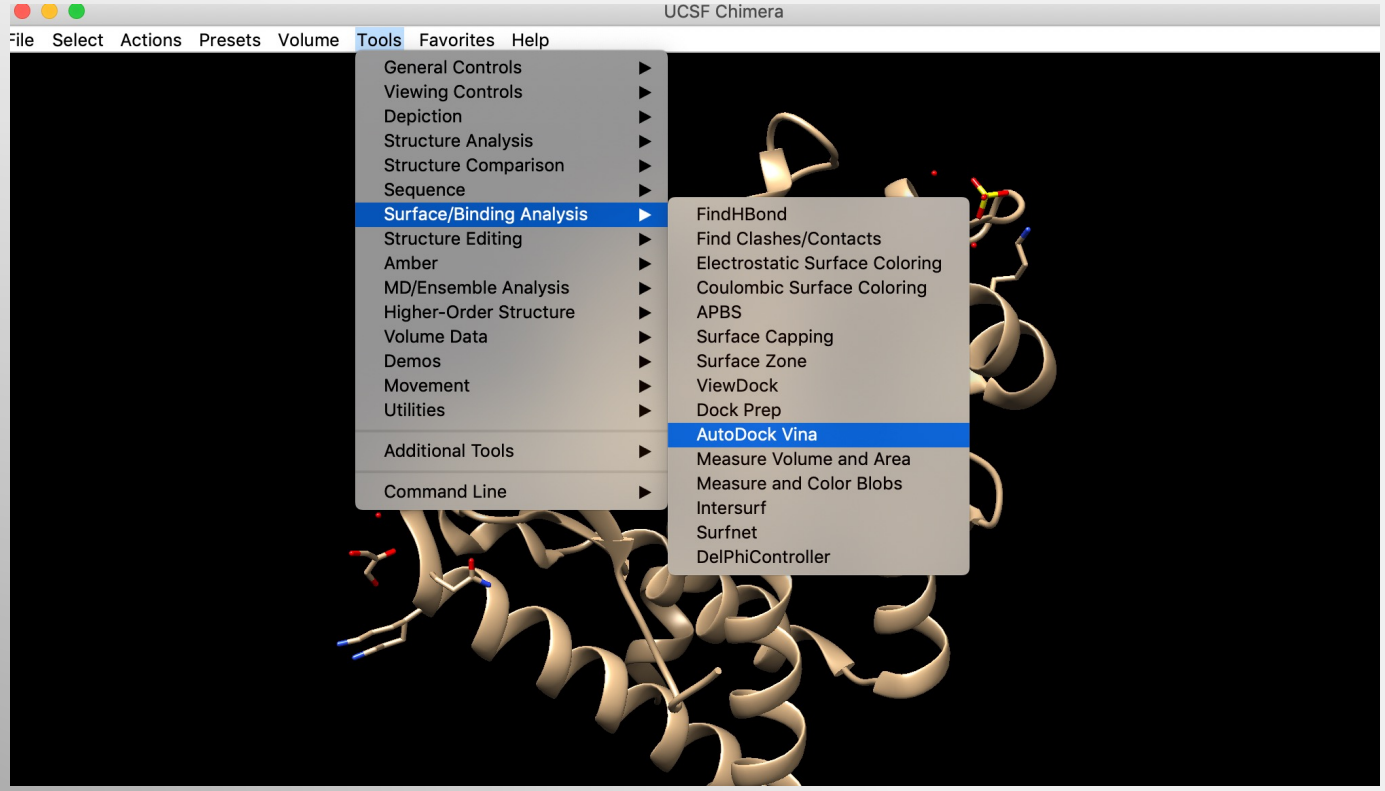


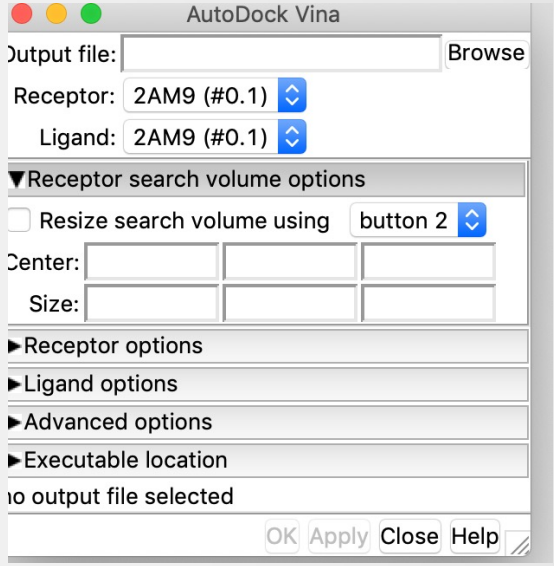
Splitting ligand in the pdb file

- If you click Model Panel under Favorites menu you can see separate models for protein and ligands

Creating pdbqt file

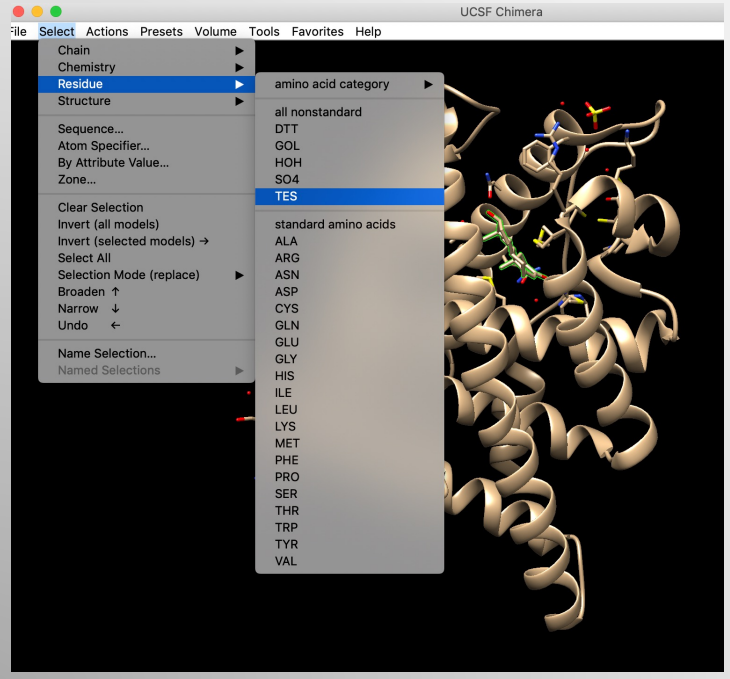
- From tools select first Surface/Binding Analysis and then AutoDock Vina
- Box shown below should appear.

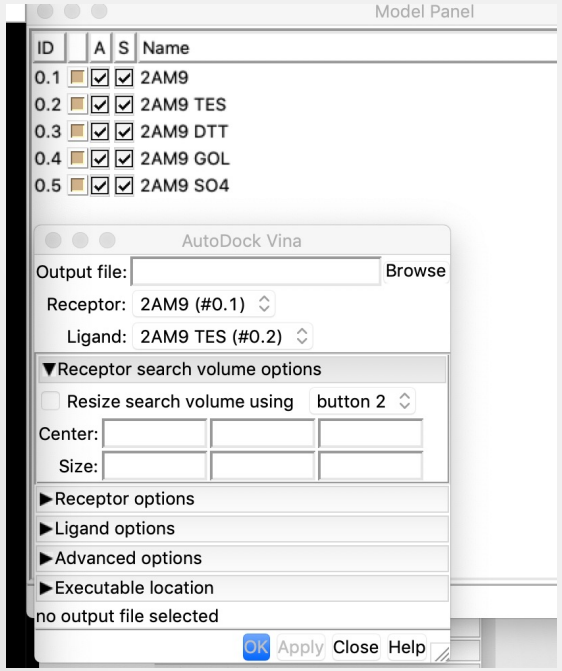


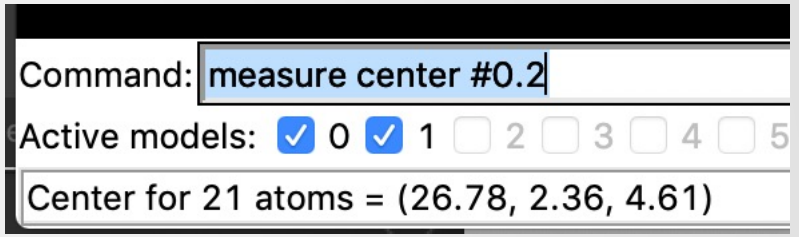


Calculate the center of grid box

- In this protein we will use the center of the ligand as the center of grid box.
- To calculate the center of the grid box in the command line you can type:
- Measure center #0.2
- #0.2 We got this from ID on the Model Panel
- Also you can select the ligand from Select,Residue,TES options

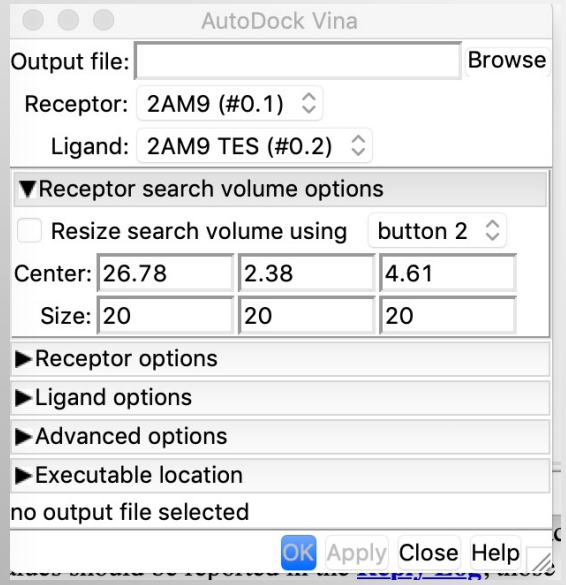






Calculate the center of grid box

- We write the coordinates of the center we got in the previous slide here Receptor Search Volume options center section.
- For size we can write 20 for each dimension
- Chimera displays the grid box as in green
- You can increase the size depends on the protein you are working.



Calculate the center of grid box

- From the Outputfile menu select the folder you want to write the files
- You can check Receptor and Ligand options menu
- Depend on your protein/ligand you may want to change some parameters.
- Here we continued with default options.
- Last executable location you should put the path for the vina executable file.
- You can get the link in the references to download vina executable.
- Basically, this will dock the ligand to the protein, while docking it will also create receptor pdbqt file
